

THE QUESTION EVERYONE ASKS

**Will AI take
my job?**

THE ONE I THINK IS INTERESTING

~~Will AI take my job?~~

What can you
do now that
you couldn't
do last year?

I Gave Claude a Body

Varun Srinivas — CTO & Chief AI Officer,
Coditas

WHAT IT TOOK

One weekend.

Making the wheels turn

Wiring it all to a small computer

Getting the camera working

Working out how far away things are

Every one of those used to be a weekend of reading on its own.

I put Claude on the car.

A chat app in a browser can only ever talk about your work. Claude Code runs on your own machine, inside whatever folder you start it in — it reads your real files, changes them, runs commands. So I started it on the Raspberry Pi bolted to the car. It writes a script, runs it, and the wheels actually turn.

A PLACE Run it on your own files, not in a browser tab.

I stopped explaining the same things.

Every session started the same way — which pin drives which motor, how the camera is mounted, what not to touch. So I wrote all of it down once, in a file it reads before it does anything.

RULES Say it once, not every time.

It kept telling me what to do.

I'd ask it to turn left and it would explain how to turn left. I wanted a driver, not a consultant. So I gave it two functions it can call itself — one returns a frame from the camera, one drives the motors for a set duration.

HANDS Let it do things, not just talk about them.

I wanted to stop standing over it.

Watching every move rather defeats the point. So I set the boundaries once — how long a single move may run, what happens if the next command never arrives, and what cuts the motors regardless.

LIMITS Decide once what happens without you.

I was typing the same things again.

Same setup, same calibration, same handful of instructions at the start of every session. Anything I'd done twice became something I could invoke by name.

SHORTCUTS Done it twice? Write it down.

LOOK WHAT THAT ADDS UP TO

Five things. Most people use one.

01	A place	it runs on your machine, on your real files	the folder it runs in
02	Rules	everything that's true about your world	CLAUDE.md
03	Hands	so it can do things, not just talk	MCP
04	Limits	what it's allowed to do on its own	permissions
05	Shortcuts	anything you've done twice	slash commands & skills

YOUR TURN

What would you solve with this?

Let's look at an example.

Sorting out your medical records

A PLACE

Every scan and lab report in one folder — out of three hospital websites and a drawer. **One evening.**

RULES

Never guess a diagnosis. Always say which file it came from. Keep the lab's own numbers exactly as they are.

HANDS

Let it search the medical research, and read the inbox where results land.

LIMITS

It can read and summarise on its own. It never edits an original.

SHORTCUTS

One you can ask for by name: everything that changed since your last appointment.

OTHER PEOPLE HAVE DONE REALLY COOL NON-CODING THINGS

MARTIN DEVIDO

Claude grows a tomato plant

Wakes every half hour. Checks temperature, humidity and soil, looks at the plant through a camera, decides whether to water it or turn on the light. Months of it, no human. The plant's called Sol.

autoncorp.com/biodome

TOBI LÜTKE · SHOPIFY

Reads his own MRI

His annual scan came back on a USB stick that only opened in Windows software he didn't have. He pointed Claude at the stick and asked for something he could actually read.

x.com/tobi

PIETRO SCHIRANO

Reads his own DNA

Handed over the raw file from an ancestry test and asked which health genes were worth keeping an eye on. Huge file — it went and found the parts that mattered.

x.com/skirano

SO — BACK TO WHERE WE STARTED

What can you do now that you couldn't do last year?

Anything.

Thank you.

Questions — and feel free to come and check out the rover.
